

Quick Commerce Search & Recommendation Insights

Objective

This repository contains product management and techno functional analysis related to search, recommendations, and merchandising systems in quick commerce applications.

The goal is to study how search ranking, pinned recommendations, and event based merchandising can improve user engagement and conversion.

Problem Statement

Quick commerce platforms often face issues such as:

- Low search recall
- Irrelevant recommendations
- Poor ranking for seasonal products
- Lack of personalization
- Manual merchandising limitations

This project explores possible improvements and feature ideas.

Key Focus Areas

- Search ranking optimization
 - Recommendation systems
 - Product pinning strategies
 - Event based merchandising
 - API understanding
 - Experimentation and segmentation
-

Sample Use Cases

1. Eid Merchandising

Pin high intent products during Eid events to improve visibility and CTR.

2. Recommendation Pinning

Allow operations teams to manually pin products:

- at product level
- at category level
- under experiment IDs

3. Search Recall Improvements

Improve handling of typo queries and low recall keywords.

Future Scope

- AI based personalization
 - Query intent understanding
 - Dynamic ranking models
 - Real time experimentation
 - Semantic search implementation
-

Repository Contents

- Product Requirement Document
 - API Flow Documentation
 - SQL Practice Queries
 - Search Case Studies
 - Architecture Diagrams
-

Author

Learning repository focused on Product Management and Techno Functional systems.
